

Build the talk. Then run it like it's on rails.

Two tools, one engine. **Prompter Studio** turns your script and slides into a timed, rehearsed project. **CuePilot** listens while you speak on stage — scrolling the script, advancing the deck, watching your pace — so you keep your eyes on the room, not the clock.

● Prompter Studio — author

● CuePilot — perform

● AUTHOR & REHEARSE

Prompter Studio

Where the talk gets built — no code, no command line.

- ☰ **Script to slides.** Drop in a Word or text script; it builds the timed deck for you.
- 📺 **Images & video.** Place clips right on a slide — they play in the live deck.
- 🕒 **Pacing budgets.** Set a time target per slide; the run is planned before you rehearse.
- ✓ **One-click handoff.** Export a project that CuePilot imports as-is.

● PERFORM LIVE

CuePilot

Autopilot for your talk — your confidence monitor on stage.

- 🎤 **It listens.** The script scrolls and the deck advances to where you actually are.
- 🕒 **Live pace HUD.** On pace, behind, or ahead — plus the “watch slides” that run long.
- 📱 **Phone & clicker.** Scan a QR for a phone remote; any USB/BT clicker just works.
- 📄 **Timing report.** Actual-vs-budget per slide after every run. Copy or export CSV.

HOW A TALK FLOWS

- 1 Build in Studio**
Script, slides, video & pacing.
- **2 Import to CuePilot**
One file. Slides & timing come across.
- **3 Take the stage**
You watch CuePilot. The room sees the deck.

The clicker always wins

A manual click is invisible to the room and always safe.

Works offline

Local Whisper mode — flaky Wi-Fi can't stop the show.

Zero dependencies

Double-click to launch. First run sets itself up.

Private by default

Nothing leaves the laptop. Your words stay yours.

Stop rehearsing against a stopwatch.

See CuePilot & Prompter Studio run a real talk, end to end.
